It's an open source project at [bench](It's super simple to run your own code comparison. You get a nice report for free, but there is also the option to pay to have a more in-depth look at how your code compares to best of breed projects. ------ jsingleton I'm curious what you all think. I've been playing with it over the last month and will keep tweaking it for next few months as new code samples come through. 1. Field of the Invention The present invention relates to a composite tungsten base alloy and a manufacturing method thereof. More particularly, the present invention relates to a composite tungsten base alloy that is suitable for products such as structural members and electronic components and a manufacturing method thereof. 2. Description of the Prior Art In recent years, lighter, smaller, more precise and more functional mechanical products are demanded for automobiles. In order to meet the demand for lighter, smaller, more precise and more functional products, the material used for such mechanical products is also requested to have greater tensile strength and bending strength, as well as higher thermal conductivity and less weight. As a material that can cope with such demands, there has been developed a composite tungsten base alloy made of tungsten and carbon in place of aluminum or the like, which is described in, for example, Japanese Patent Application Laid-Open Nos. Hei 5-318534 and Hei 6-202740 and U.S. Pat. No. 5,482,773. This tungsten base alloy (hereinafter also referred to as composite tungsten base alloy) is manufactured by performing powder metallurgy with a sintering temperature of 1500° C f678ea9f9e
